# Barcodes

At Durcard, we have the ability to print many types of barcodes, the most popular of which are codes 39 (3 of 9) and 128. If you are not sure what type of barcode your system requires, we strongly recomend contacting your point of sale (POS) system provider. They can assist you with which type of barcode will work and the necessary characters for your particular system.

If you have any further questions:
Please don't hesitate (P) 1·800·318·3500 or (E) contact@duracard.com

Here you can test the most commonly-used codes for plastic cards with your POS System.
Cards are actual size

Code 39:

The 3 of 9 barcode gets its name because each character is made of 9 elements, 3 of which are wide.

Code 128:

The 128 barcode is named as such due to the fact that it can use all 128 characters of ASCII.

QR Codes are newer two-dimensional barcodes which are gaining much popularity for many different uses. Anyone with a smartphone may download QR-reading software which often reads other barcodes as well. The code can represent many things including a URL, an email address, a mailing address or even a bit of text!
